

Event Management System

Q-PASS

FY2026 ICT Business Advancement Support Project: Proposed AI-Utilized Solution
for Generating Technology Advancement Stages

Challenges faced by the three parties involved in the exhibition

Challenges for the organizers	Challenges for Exhibitors	Visitor challenges
• Exhibitor management tasks are extremely time-consuming (document checking, reminders, inquiries). • Cost burden of dedicated staff and outsourced administrative work • Maintaining a high rate of exhibitors is key to business continuity , but there is no guaranteed way to do so.	• It is difficult to grasp the situation of booth visitors (purpose, budget, timeframe, decision-making authority, etc.). • Differences in the experience of sales representatives lead to variations in the quality of sales negotiations. •The ROI of exhibiting could not be quantitatively proven, and the decision for the following year was based on intuition.	• I can't find something that suits me from among the many booths. • There is no way to efficiently travel around within a limited time. • Dissatisfaction level decreases if the expected encounter does not occur.

The challenges faced by the three parties form a causal chain that originates from the "visitor experience."

Overall Solution Overview

concept

Generative AI will transform trade show encounters and business negotiations.

An integrated platform that deeply understands visitor intentions, supports exhibitors' business negotiations, and automates organizer operations.

A structure in which six functional modules work together.

Solution ý: Visitor AI Concierge

An AI guide that deeply understands visitors' intentions through dynamic surveys and continuous dialogue.

Feature Overview

We will continuously communicate with attendees from the time of application through to the end of the event to understand their individual intentions. This will be provided via the web-based My Page (no app required).

Main functions

- [During registration] A dynamic questionnaire with 3-5 questions. The AI generates questions dynamically based on your answers.
- [Before arrival] You will be guided to your My Page via email, and the AI will suggest recommended booths and routes.
- [On the day]

Scan the QR code inside the venue to activate contextual dialogue.

• [Ongoing use] You can consult about congestion status and recommended information at any time via the chat UI on your My Page.

• [Participation format] Participation is recommended (can be skipped) as the default, but can be made mandatory at the organizer's discretion.

Beneficiaries and Value

beneficiary	value
Visitors	Efficient encounters with booths that suit you, increased satisfaction
Organizer	Acquiring visitor intent data and improving satisfaction to enhance visitor attraction.
Exhibitors	Gaining business opportunities based on high-quality intent data

Dialogue Image

[At the time of application]

AI : What is the biggest problem you want to solve by attending today's event?

Attendee: It's difficult to see the ROI of marketing.

AI : What specific tools do you use? Visitor: I use XX and YY together ... (3-5 questions to delve deeper into their intentions)

[Scan the QR code inside the venue on the day of the event]

AI : You just saw Company A, right?

If the topic is ROI measurement,
Company C's booth is also related. It's a 1-minute walk away.

Technical implementation method

- Dynamic dialogue engine powered by Generative AI (LLM)
- Integrated analysis with attribute and behavioral data
- Cost optimization: Minimizes API charges with a three-tier structure of rule-based + lightweight AI + advanced AI

Solution ý: AI Intent Inference Layer

A backend AI that integrates heterogeneous data and infers visitor intentions as structured information.

Feature Overview

By integrating multiple data points such as dynamic survey results, behavioral data, and dwell time, we infer visitor intentions as structured information.

Main functions

- Inferences in the consideration phase: Information gathering / Comparative analysis / Specific analysis •
- Inferences in areas of interest: Extraction of priority (multiple) by theme • Inferences in the degree of involvement in decision-making: Strong involvement / Partial involvement / No involvement • Inferences in the expected implementation period: ~3 months / 3-6 months / 6-12 months / Undecided • All inference results must be assigned a degree of certainty (high/medium/low), and should be treated as "inferences" rather than "facts". to clearly

Beneficiaries and Value

beneficiary	value
Exhibitors	Transform the quality of business negotiations by generating card content for reception mobile apps.
Organizer	The source of the analysis data for the dashboard

Inference item image

Examples of inferred intent items

- Consideration Phase ý
Under Comparison [Probability: High]
- Areas of Interest ý
DX Tool Integration [High Confidence] ý ROI
Measurement Improvement [Medium Confidence]
- Degree of involvement in
decision-making ý Strong involvement [Probability: High]
- Estimated implementation
period : 3-6 months [Probability: Medium]

Technical implementation method

- Intentional inference of multivariate data using generative AI • Continuous improvement of inference accuracy through batch processing • Tuning tailored to the industry characteristics of each organizer
- Noh

Solution ý: Exhibitor registration mobile app (added functionality)

The moment an exhibitor scans a visitor's QR code, AI displays conversation guidance for business negotiations.

Feature Overview

The AI presents the optimal way to initiate a conversation with each visitor to the booth receptionist. This is the core function of this project, transforming the first 30 seconds of a business negotiation.

Main functions

- QR code scan ý Information retrieved from the AI intent inference layer ý Converted into conversational guidance ý Immediate display
- Inference results are transformed and presented as "conversational hints" rather than "raw labels" . • By not displaying AI inference raw, visitors are not given the feeling of being "analyzed". • Visited booth history is also displayed to supplement the context of the business negotiation. • Caching design minimizes communication delays.

Beneficiaries and Value

beneficiary	value
Exhibitors	From the first 30 seconds, get to the heart of the conversation and dramatically improve the quality of your business negotiations.
Visitors	You can experience business negotiations tailored to your needs.
Organizer	Improve exhibitor business negotiation ROI ý Improve exhibition continuation rate

Visitor card display example

Mr. Taro Yamada / Marketing Manager, XX Co., Ltd.

Topics of Interest

Digital transformation of B2B marketing

A recommended way to start a

conversation is , "What is the biggest problem you want to solve in current marketing?"

Points to subtly check: • Level of interest in

ROI measurement • Status of integration with existing tools • Progress phase of consideration

(12-minute stay at company A)

Technical implementation method

- Adding functionality to existing apps • Prompt design for converting AI inference results into conversational guidance is proprietary know-how • Design for immediate integration with QR scanning

Solution ý: Copilot for Exhibitors

AI-generated tasks assist in exhibition preparation, preventing input errors and missed submissions at the upstream stage.

Feature Overview

It is provided completely free of charge to exhibitors. It is distributed as part of the organizer's exhibitor management options. It helps prevent problems in the early stages of exhibition preparation.

Main functions

- [Input Assistance] AI assists with input based on context and proactively warns of errors.
- [Industry Document Support] Supports hazardous materials documents, electrical capacity applications, etc., with example formats.
- [Individual Reminders] Determines the progress of each exhibitor and sends notifications at individual timings.
- [Q&A] AI provides immediate answers to general questions from exhibitors.
- [Escalation] Only questions beyond the scope of the FAQ are sent to the organizer.

Beneficiaries and Value

beneficiary	value
Exhibitors	Reduce stress during exhibition preparation and minimize rework due to errors (free of charge)
Organizer	By preventing errors in the upstream process, the processing load of the subsequent Autopilot stage is also reduced accordingly.

CoPilot operation example

[Input Assistance]

Exhibitor: I'm confused about the power capacity item...

Copilot: Normal lighting plus two PCs consumes around 500W. If you have a demo unit, please consider submitting an additional application.

[Reminder]

Copilot: The hazardous materials permit application has not yet been submitted. If open flames will be used in the demonstration, it must be submitted at least 3 days in advance.

[Q&A] Exhibitor: I

would like to change theýýýý (move-in time).

Copilot: If it's by 12:00 on the same day It can be changed automatically. Procedure ý

Technical Implementation

Methods : • Input assistance using generation

AI • Prompt and knowledge base based on the organizer's business expertise • Automated response logic for standardized FAQs

Solution 5: Autopilot Exhibitor Management for Organizers

Document checking, reminders, and inquiry handling are automatically handled by a generation AI. The direct objective is to reduce the workload of the organizers.

Feature Overview

This feature uses AI to automatically handle document checks, reminders, and inquiries that organizers have traditionally performed for exhibitor management. It evolves the "Inquiry Administrative Office" and "Setup Assistance" services.

Main functions

- [Automated document check] AI checks both content and format, and automatically approves documents that are fine.
- [Notification of items requiring confirmation] Problem areas are highlighted and notified to the organizer.
- [Automated handling of deficiencies] Routine communication is automatically completed by AI (minor omissions, etc.).
- [Escalation of decisions] Only cases requiring the organizer's decision are notified, and past handling examples are provided.

Also note

- [Transformation of Cost Structure] From man-month basis to fixed costs using AI

Beneficiaries and Value

beneficiary	value
Organizer	Significant reduction in exhibitor management workload (targeting a 70% reduction compared to conventional methods)
Exhibitors	Improved response speed from organizers and smoother handling of issues.

AutoPilot's processing flow

Document submission from exhibitors

Organizers focus on decision-making.

Technical implementation method

- Document content understanding by generation AI
- Rule engine based on the organizer's business knowledge 8
- Automated response/escalation decision design 12

Solution 6: Dashboard for Organizers

Real-time and annual analysis ensures accountability to exhibitors and sponsors.

Feature Overview

This analytical screen allows organizers to understand the event's status, use it for accountability to exhibitors and sponsors, and for making decisions about the following year's event. Its value increases with the accumulation of annual data.

Main functions

- [Real-time] Visualization of visitor intent distribution, booth access, and movement within the venue.
- [Exhibitor Report] "X decision-makers considering the budget visited your booth," etc.
- [Annual Comparison] Parallel comparison with previous year's data, visualization of shifts in intent trends .
- [AI-Suggested Planning for Next Year] Suggestions such as "Increase the number of sessions on this theme next time."
- Continuous analysis of annual events as a "slow-motion portfolio."

Beneficiaries and Value

beneficiary	value
Organizer	Accountability to exhibitors and sponsors, data-driven planning for the following year , and providing evidence to improve exhibitor retention rates.

Dashboard display image

[Real-time visitor intention distribution]

Under comparison 42% Information being collected 28% Specific consideration 21% Uncategorized 9%

[Annual

Comparison] Number of Visitors: +12% compared to 2024; Exhibitor Retention Rate: +8% compared to 2024

[AI Planning Proposal for

Next Year] 63% of attendees showed strong interest in "ROI measurement." We recommend doubling the number of slots allocated for related sessions.

Technical implementation method

- Data visualization platform
- Aggregation of AI intent inference results
- Automatic report generation function

Experience changes by stakeholder

Before (Current Situation)

After (after Q-PASS implementation)

Organizer

- Multiple dedicated staff members for exhibitor management
- Excessive paperwork and follow-ups • No effective measures to address the declining exhibitor retention rate
- Explanations are qualitative

- AI Autopilot automates processing • Organizers can focus on decision-making • Exhibitor ROI can be presented quantitatively • Evidence for improved retention rates is accumulated

Exhibitors

- Customer service based on intuition • Significant differences in negotiation quality due to varying sales experience • Inability to quantitatively explain ROI of exhibiting
- Decisions for the following year based on intuition

- AI conversation guidance at reception • Core conversation from the first 30 seconds
- Improved conversion rate and order value
- Quantitative data for explaining ROI internally

Visitors

- Wandering around based on a paper map and intuition • Unable to find a booth that suits you • Wasting time on disappointing encounters • Lack of lasting satisfaction

- AI concierge provides personalized optimization • Suggests efficient sightseeing routes • Encounters that match your intentions • Increased satisfaction and repeat visits the following year

The changes in the experiences of the three parties are cascading and directly impact the business continuity of the organizer.

Methods for verifying effectiveness

Before/After comparison proves that "the implementation was effective."

Layer 1: Exhibitor Post-Event Questionnaire	Implementation Period: A survey was conducted among exhibitors immediately after the demonstration event during the subsidy project period . A cross-tabulation of Q1 and Q2 quantified the correlation that "exhibitors who utilized AI functions had a higher rate of increased business negotiations." • Q1: How did the number of business negotiations this time compare to the previous time you exhibited? • Q2: Did the AI function (visitor card) contribute to improving the quality of business negotiations? • Q3: What specific situations contributed to this (free response)? • Q4: Do you intend to exhibit again at the same event next year?
Second Tier: Exhibition Retention Rate (Evaluated for the following year)	Implementation period: The retention rate of exhibitors for the same event in the following year is compared with past trends. This is the most reliable lagging indicator and the most compelling management indicator for organizers. • Compare the rate of exhibitors continuing to exhibit in the following year with the previous three years. • Analyze the difference in retention rates between exhibitors with high and low rates of AI function utilization.
Quantitative analysis of third-tier behavioral data	Implementation period: Quantitative verification using data accumulated over one year of operation. Implementing a continuous improvement loop for AI inference accuracy. • Comparison of appointment acquisition rates between business meetings where visitor cards were viewed and those where they were not. • Accuracy rate of AI inference items (accumulated exhibitor feedback). • Analysis of effectiveness differences by industry and event scale.

Division of roles in promoting joint development

In carrying out this project, we would like to ask you to take on the following roles and responsibilities.

Division of roles

region	Q-PASS (Copro System)	ISCO
Product development	Design, implementation, and quality assurance of all functions.	Review of functional requirements, improvement suggestions
AI training data	Data pipeline construction, inference engine development	Providing business knowledge (document specifications, reminder procedures, decision criteria, etc.)
Business process analysis	Design of analysis methods, conducting interviews.	Disclosure of business processes, response to interviews.
Demonstration experiment	Function provision, operational support, data collection design	Functional testing conducted at demonstration events (ResorTech), on-site Operation
Effectiveness Verification	Design of verification methods, data analysis	Survey cooperation from exhibitors and visitors, and sharing of results.
Project Promotion	Overall progress management, support for the subsidy office.	Monthly regular meetings and participation in decision-making.
